INTELLIGENT REHABILITATION TECHNOLOGY

REHABILITATION USING A 'SMART' THERAPY BALL

A Digital system for interactive exercise and performance management.

Innovative and groundbreaking development makes it possible to turn rehabilitation exercises performed using balls into a challenging and fun interactive game, all while providing personal feedback and monitoring the patient's level of performance and progress over time.

The smart therapy ball from **PLAYWORK** looks like existing balls you are familiar with, but the big difference is that our 'physio' ball comes with an electronic component + sensors inside, which is actually a unique IoT platform that makes the ball digital and smart.

The device is specially recommended for use by kids with Special Needs to practice various skills like: Coordination, Visual orientation, perception, visual tracking, increase strength and more. **PLAYBALL** is used almost at any relevant settings including schools, recreational, clinics, hospitals and at home. The system is portable and can be used in any existing space at the clinic or home without need for cameras or other external device. Operating the system is simple and intuitive for any user from the age of 5-99.
